1 Introduction

It is quite easy to make hyperlinks in [L^AT_EX](#) and to manage the bibliography [1, 2].

And we can also embed our R code inside the doc for easier use.

2 Embed R code ?!!

2.1 Basic test

```
aa <- rnorm(100000)
mean(aa)

## [1] -0.0008628805
```

and we can then get the results inside the text with `\Sexpr{mean(aa)}` which gives us $-8.6288048 \times 10^{-4}$

And it also handles nicely integration of plots in Latex with label for future reference in the text. Exemple with figure 1. Still have to manage the position of figures (in the header of code chunks).

```
aa <- rnorm(100000)
hist(aa)
```

```
mean(aa)

## [1] -0.002572049
```

Useful to keep in mind :

fig.lp: ('fig:'; character) label prefix for the figure label to be used in `label{}`; the actual label is made by concatenating this prefix and the chunk label, e.g. the figure label for «foo-plot»= will be fig:foo-plot by default

2.2 Trying out equations

We first write equation (7.52) and use the approximation provided in the exercise :

$$GCV(\hat{f}) = \frac{1}{N} \sum_{i=1}^N \left[\frac{y_i - \hat{f}(x_i)}{1 - S_{ii}/N} \right]^2 \quad (1)$$

$$\approx \frac{1}{N} \sum_{i=1}^N [y_i - \hat{f}(x_i)]^2 \quad (2)$$

$$= \frac{1}{N} \sum_{i=1}^N [y_i - \hat{f}(x_i)]^2 + 2 \frac{1}{N} \sum_{i=1}^N [y_i - \hat{f}(x_i)]^2 \frac{S_{ii}}{N} \quad (3)$$

Using $\frac{1}{N} \sum_{i=1}^N [y_i - \hat{f}(x_i)]^2$ as an approximation of σ^2 and $S_{ii} = d$, we can then rewrite this as

$$\frac{1}{N} \sum_{i=1}^N [y_i - \hat{f}(x_i)]^2 + 2 \frac{1}{N} \sum_{i=1}^N [y_i - \hat{f}(x_i)]^2 \frac{S_{ii}}{N} \approx \sigma^2 + 2\sigma^2 \frac{d}{N} \quad (4)$$

This is equivalent to equation (7.26), only difference being how we estimate σ^2 .

Figure 1: A nice caption and label for future reference
